1) Have any data been collected for this study already?

No, no data have been collected for this study yet.

2) What's the main question being asked or hypothesis being tested in this study?

We are examining the relationship between algorithmic knowledge and preference for tasks to be completed by AI vs humans, and whether this relationship varies as a function of the subjectivity required by a task.

3) Describe the key dependent variable(s) specifying how they will be measured.

The dependent measure will be the 26 tasks from Castelo, Bos, & Lehmann (2019) as measured in that paper.

4) How many and which conditions will participants be assigned to?

There will be no conditions. Our independent variable will be participants' algorithmic literacy as measured using a 25-item multiple choice test. The sum of the correct responses will serve as their knowledge level.

5) Specify exactly which analyses you will conduct to examine the main question/hypothesis.

We will calculate participants' average preference for AI vs humans across the 26-tasks. We will then regress this average preference on their algorithmic literacy score.

Additionally, we will have a separate group of 50 participants rate each of the 26 tasks on its level of required subjectivity to complete the task. We will then regress preference for AI vs human for each task on algorithmic literacy, the average subjectivity score for that task, and their interaction including fixed effects for participants.

6) Describe exactly how outliers will be defined and handled, and your precise rule(s) for excluding observations.

We include three attention checks. One is an instructional manipulation check (IMC; "This question is NOT interested in your marital status. Instead, it is designed to ensure you are taking the time to read all questions, even towards the end of the survey. As such, instead of indicating your marital status from the options below, please select other and type the word test into the box provided below"). In line with prior research (Pennycook, Cannon, Rand 2018), we will also include two attention checks: participants will be asked (i) if they responded to the best of their abilities and (ii) if they responded randomly at any point during the survey. We will conduct our analyses excluding those who failed the IMC, those who answered "no" to the second attention check, and those who answered "yes; to the third attention check.

7) How many observations will be collected or what will determine sample size? No need to justify decision, but be precise about exactly how the number will be determined.

We will post the survey for 1,000 participants.

8) Anything else you would like to pre-register? (e.g., secondary analyses, variables collected for exploratory purposes, unusual analyses planned?)

We will collect demographic information, political affiliation, religiosity, and household income.
