1) Have any data been collected for this study already?

No, no data have been collected for this study yet.

2) What's the main question being asked or hypothesis being tested in this study?

We are examining whether the relationship between AI literacy and AI receptivity is stronger when people are considering using AI because it is magical (vs. capable).

3) Describe the key dependent variable(s) specifying how they will be measured.

The DV will be likelihood of using AI to create a song for a friend's birthday.

"... how likely would you be to use AI to write a song for a friend's birthday?" on a 7-point scale (1 = very unlikely, 7 = very likely)

4) How many and which conditions will participants be assigned to?

There are two between-subject conditions: magical vs. capable. In addition to that, we will have one measured variable capturing AI literacy. This will be assessed using a 17-item multiple choice test. The sum of the correct responses will serve as their AI literacy level.

5) Specify exactly which analyses you will conduct to examine the main question/hypothesis.

We will regress the DV on condition (0 = capable, 1 = magical), AI score (mean-centered), and their interaction.

6) Describe exactly how outliers will be defined and handled, and your precise rule(s) for excluding observations.

We include one instructional manipulation check (IMC; "Please indicate you are taking the time to read the instructions carefully. This is not a trick question. What is 12-4? Please use a numeric value only (no letters)."). This will be asked at the beginning of the survey and participants who fail this question will not complete the survey.

7) How many observations will be collected or what will determine sample size? No need to justify decision, but be precise about exactly how the number will be determined.

The survey will be posted online for 1000 participants.

8) Anything else you would like to pre-register? (e.g., secondary analyses, variables collected for exploratory purposes, unusual analyses planned?)

We will also measure demographic information (gender, age, income).
